In lieu of a resume

Proof of WorkMarc J. Greenberg

Everything on this page is running, published, or in print. No titles, no employment dates, no credentials. Each line is something you can open and check for yourself in about a minute.

He builds AI-native software and advises the people buying it. Delray Beach, Florida. The practice is Braintrailz; the products are BLT Core and Waypoint.

Running in production

Two point of sale buildouts, with real restaurants on the other end.

LiveAI-native point of sale and paymentsEleven repositories

BLT Core

Payments freedom, not another terminal lease.

Co-founder and CTO of Beyond Limited Thinking. Payments-neutral, AI-native point of sale infrastructure built for ISOs, banks and strategic partners. Recruited the engineers, set the engineering and review standards, defined the delivery model, and put it into production in a working restaurant in New York. Eleven independent repositories, each with its own release line, behind one payments adapter layer across DataCap, Stripe and Square.

bltwai.comthe payments layerthe CLI on npm

Deployed, pilot pendingClean-room POS coreRelease 0.1.3

Waypoint

Written fresh from the spec, not ported from the old code.

A clean-room order-taking core for a Toast-class full and quick service POS: orders, tender, kitchen display and money. Written fresh from a normative spec, integrating with BLT's gateway and payments adapters over APIs, codebases kept separate. Multi-tenant from the first migration, with row-level security isolating every location. Offline is not a claim: a timed thirty minute outage drill, three terminals, a hundred and fifty mutations, zero lost lines.

Published and forkable

Build the tool, publish the method. Every one of these is public, and most of them are a fork away from being yours.

Agent skillOctober 2026

Trailcard

Intent is not enough.

Turn a bare instruction into a card an agent can safely act on, then audit what it says it did. Written after arguing the case in print, because an argument nobody can run is just an opinion. Works across Claude, Codex, Grok and Muse.

github.com/braintrailz/trailcardthe argument behind it

Toolkit and agent skills26 commandsIn daily use

schwab-kit

Read only, until it earns the right to write.

A toolkit and four agent skills that read a live brokerage account and check proposed orders against a rules file before anyone types them. Integer-cent arithmetic, an NYSE calendar, and a rules engine that fingerprints every verdict. It cannot place an order, and will not for thirty clean trading days. Intent is not enough, with real money on the other side. The account is private. The reference is not.

the command reference

Editor extensionVS Code and Cursor

Muse CLI Chat

Wrap the harness. Don't rebuild it.

Meta shipped Muse Code as a command line agent with no editor surface. Rather than rebuild the agent, this wraps the harness it already had, so the same agent sits next to your files. Written with Muse, about Muse. Published on Open VSX.

install ithow it was built

Agent skillOpen source

Aristotle Skill

Channel a thinker's worldview, not a costume.

Grounds answers in what a thinker actually wrote, reasons in their method, and tutors instead of lecturing. Fork the roster and add the next one.

github.com/codemarc/aristotle-skillship the engine

Agent skillOpen source

Solid Skill

Cut word salad and word vomit. Name the pattern.

Writing is solid when it has no voids. Diagnose the failure, run the shuffle test, return two cuts so the writer starts catching it without the tool.

github.com/codemarc/solid-skill

Agent skillTwo regions mapped

Tech Ecosystem Map

The map is not the territory.

Renders real-geography, layered maps of a region's tech, AI and capital ecosystem from live-verified companies and actual census boundary data. Two instances published so far.

MethodPractice

Repack

Conserve the knowledge. Clear the clutter.

What to keep when the tools turn over every quarter. Preserve what the experiments taught you, then rebuild the kit for the trail ahead. This is the discipline that stops a fast-moving stack from quietly becoming debt.

braintrailz.com/trailcraft/repack

Field guideBook

I Built My Own Recruiter

Run your job search like a software project.

Part memoir, part manual. Score, sweep, outreach, then fork the method. Written while doing the thing it documents, which is the only way to write a method that survives contact.

read it

The argument, in writing

Dated, public, and specific enough to be wrong.

November 1, 2026

After the First Blaze

What the first pass teaches you, and what repacking looks like when you set off again on a quieter trail.

braintrailz.com

September 28, 2026

Intent Is Not Enough

What happens when AI stops answering and starts acting. Intent tells a system what you want. It does not tell it what success looks like, what it is allowed to do, where it may use judgment, or how anyone knows

afterward what actually happened. That gap is an engineering standards problem.

August 29, 2026

Finding / Founding BrainTrailz

Thirty years of rediscovering the same problem in different forms. The systems we connect are intelligent now, and moving between them put us back in the integration business, except this time the human is the integration layer.

February 2026

The Director of Agent Orchestration

How software leadership moved from writing the code to casting, scripting and directing autonomous agents, and what that does to a delivery model and a job architecture.

blog.codemarc.net

Still on the fire

Published as unfinished on purpose. Pretending everything is shipped is how a practice loses credibility.

No followers. No likes. Just real work.

A professional network for people tired of polish, where presence is earned through contribution rather than performance.

linkedtwin.net

The kit

The tools actually carried, by house: Anthropic, Google, Meta, OpenAI, Microsoft, xAI, open source, and what is coming out of China. Chat, code, assistant, harness.

Updated October 14, 2026

The Backpack

Carrying every house is insurance. It is how you know what a model family is good at this month rather than what it was good at when the slide was made, and it is why BLT has model-agnostic interfaces rather than one vendor's roadmap baked in. The page carries a date, because a stack without one is a stack nobody should trust.

braintrailz.com/backpackall of Trailcraft

Everything here is dated and public. The point of leaving a trail is that someone else can walk it.
